

Portable Faraday Cage

- you will need wire (not nylon) mesh. Copper is the best but aluminum is okay.
(You can buy this at Home Depot or Lowe's type stores)
- cut out a piece of mesh three times the size of your radio
- remove the antenna (if it is removable) and tape it to the side of the radio
- wrap the radio up in 1 or 2 washcloths to make sure the radio does not come in contact with the mesh
- roll your radio up in the mesh so it goes all the way around your radio at least twice
- fold up the bottom
- now you will need to remove 2 or 3 strands of wire off the edge of the mesh to use as thread
- sew the bag together with the wire strand to hold it together on the rolled side and the bottom
- now fold down the top and sew that as well
- cut off any excess
